AI Chat Log

Deliverable 2 | Summary of our use of ChatGPT

During this assignment, we used ChatGPT mainly to ask questions, understand Python concepts, and get feedback on our code.

1. Python environment and Git

We asked how to create a virtual environment, connect our project to GitHub, and work with branches, commits, and pull requests.

2. Task 1 and Task 2

We asked questions about reading files, different text encodings, regular expressions, and recursion. ChatGPT helped explain how these concepts work and how they relate to the assignment.

3. Task 3 and Task 4

We asked about using NumPy and Pandas, especially for handling unusual prices, calculating refund ratios, and organising data into tables.

4. Task 5

We asked how to connect our existing functions into one workflow. ChatGPT explained the process and provided example code for combining the functions and saving the output files.

5. Debugging

We also asked for help understanding error messages, checking our code, and solving problems with different Python environments.

Summary

We mainly used ChatGPT to ask questions and understand parts of the assignment. It also provided explanations, code examples, and suggestions that helped us work through problems. We reviewed and tested the code during our work.
